

Aphids

Description

Aphids, or plant lice, are typically referred to a super family of insects which includes over 4.000 species of plant-specific parasites.

Aphids are approx. 4 mm in size, have a bulbous abdomen and can be many different colors. They are among the most destructive pests to affect cultivated plants in temperate regions. Winged aphids are especially dangerous for your crops, since they destroy plants much faster than regular aphids. Aphids are the fear of many growers, as they can cause yellowing, mottled leaves, stunted growth, curled leaves, browning, low yields and even death in plants.

Visual Observation

Aphids can cause decreased growth rates, mottled leaves, yellowing, stunted growth, curled leaves, browning, wilting, low yields and death in plants.

Treatment & Prevention

See **GrowSafe™** instructions on the label.
